

## Stop in northern scene of the Svalbard

I will start & stop in northern scene of the Svalbard archipelago by finding that here in the polar bear realm the electronic mail walks. Four our partners from the principle Clean polar station in Hornsund presented to us an envelope with a few printed letters from about fourteen days back. Our favorable position is that there is another station of the College of Wroclaw around six kilometers behind us and since we have great connections we can coordinate. A tea greeting or a plunk down in warmth is normal just as sending the most recent data about the whereabouts of bears.

Our polar endeavor under the Řehák – SPELEO organization has obtained consent from the nearby lead representative to utilize an old chasing lodge Hyttevika, arranged in roughly 50 meters wide path of coast, past which a 500 m tall pinnacle of Gulliksen rises. It is a splendid spot for a chasing lodge in light of the fact that pretty much every polar bear which goes through from the North and following its base senses proceeds with further to Hornsund. They need to experience this tight spot to return toward the upper east islands.

I need to additionally explain the term chasing lodge. It is a wooden thin structure very nearly 3 m wide and around 11 m long. It is enclosed by pipe tape from all sides and from the rear is leveled with mud and shakes. A tall European can fix up just in the center just underneath the highest point of the rooftop protected with old papers. Four thick logs shield the passageway from inquisitive polar bears. They are

constantly placed into the entryway regardless of whether we leave just for a few hours. This 'shack' is a carefully secured normal social sight and the greater part of the cold travelers who have been there can affirm that it is one of the most supernatural lodges in Svalbard.

Hyttevika's allure is difficult to portray, you simply need to encounter it. This lodge has been our base, our little however comfortable and warm home for a few campaigns. We generally return there wet, some of the time tired to death from making a trip to chunks of ice, ice sheet caverns and profound wells around. Our examination program is centered around recording of changes and improvement of icy masses and their depleting frameworks – ice sheet gives in, wells and channels and simply those frameworks all in all.

We are encountering wonderful minutes at Hyttevika. The 12 PM sun in a real sense pours over the entire coast with its brilliant shading, delicate sparkle and long shadows as should be obvious in the photos, taken in 12 PM daylight in wonderful climate. White stone of the Hyttevika sound proceed with the path of coast toward the North named Kvarcittodden, which can be deciphered as a Quartz promontory. It truly sparkles through its many white quartz rocks.

Inside the extent of the arrangements and testing of the stuff Szymon and Anka (Clean piece of our team) took our [aluminum boat](#) Marine 450 U and engineless (just with paddles) went straight into the inlet. The boat is astoundingly controllable so we didn't have the opportunity to watch where Szymon stowed away on account of the quickness with which he was going. At that point abruptly we saw that the [aluminium boats for sale](#) is moving recognizable more slow than before despite the fact that the paddles go at max throttle. Sooner or later we knew precisely why.

Szymon and Anka found a few ton gauging gliding ice shelf adrift and hauled it attached to paddles to the narrows. Since there is under 5 m of water on account of the submerged rocks, the floe stayed sitting on the base and Szymon cut an around 200 kg enormous piece and hauled it to the shore. We broke the floe to more modest pieces and put it into pots and buckets that we found in the lodge. We in this way obtained a 1500 years of age excellent chunk of ice water – perhaps from the Hans ice sheet or one of the fjords. The huge floe stayed in the inlet for just about fourteen days before the breeze and water flows blew it further North during the elevated tide.

We had plenty of neighbors from the creature domain around the lodge that stayed with us yet about that in the following article.
